

BUILD & DEPLOY

Your Professional Portfolio Website

A beginner-friendly, copy-ready workflow using ChatGPT + Claude + GitHub Pages

Worked example: GLEEBOI • Data Scientist | Machine Learning Engineer

GOOD **What this PDF is designed to do**

Take someone from “I have a CV but I do not know how to build a portfolio” to a live GitHub Pages website. The guide explains what the human does, what the AI does, and the final result.

Version note: GitHub Pages instructions were checked against current GitHub documentation while preparing this guide. GitHub's interface can change, so labels may occasionally move while the underlying workflow remains similar.

Table of Contents

Click a section title in a PDF reader to jump to that section. The HTML version can use the same structure as anchor links.

23	Screenshot Plan for the HTML Version
24	Final Workflow: From CV to Live Portfolio

TIP

How to use the guide

Read it once from beginning to end if this is your first portfolio. After that, use the troubleshooting and update sections as a reference whenever you change

1. What This Guide Does

This is not a guide that assumes you already know HTML, CSS, JavaScript, Git or GitHub. It treats the website as a small project and explains the handoff between AI tools and the human.

The basic idea is simple:

- **You** provide the truth: your CV, projects, certifications, links, experience and preferences.
- **ChatGPT** helps organize your information, identify gaps, prepare instructions and review the finished portfolio.
- **Claude** acts as the website-building partner. It can generate and edit the HTML/CSS/JavaScript files from your instructions.
- **GitHub** stores the website files and can publish them through GitHub Pages.
- **You** perform the final human check before sending the link to recruiters.

CHECK Golden rule

AI can write the website, but it should never invent your education, employment, certification dates, project results, links or years of experience.

2. What You Will Build

The finished result is a professional static portfolio website. A static site is a collection of files that the browser can load directly. For this workflow, you do not need a backend server.

The GLEEBOI example uses a futuristic, restrained data/AI aesthetic rather than a generic template. The original design brief specifies HTML5, CSS3 and vanilla JavaScript, with no Bootstrap, Tailwind or React, and emphasizes a premium visual language inspired by products such as OpenAI, Vercel, Linear, Anthropic, GitHub, Framer and Stripe without copying them. ■filecite■turn1file0■

Recommended portfolio sections

Section	Purpose
Hero	Immediately tells a recruiter who you are and what you do.
About	Provides professional context without turning into a long biography.
Quick Facts	Gives a fast snapshot of education, location, focus, tools and interests.
Skills	Shows relevant technical capabilities.
Experience	Shows professional or internship evidence.
Projects	Provides proof that you can apply your skills.
Certifications	Provides verifiable learning evidence.
CV / Resume	Lets recruiters download your current CV.
Contact	Makes it easy to email, view LinkedIn or visit GitHub.

A strong portfolio is not simply a pretty homepage. Its job is to reduce recruiter uncertainty: Who are you? What can you do? Have you built anything? Can I verify it? How do I contact you?

3. The Three-Person Workflow

Think of the process as a small team where each member has a different responsibility.

Role	Main job	Do not delegate blindly
You	Provide accurate information, make decisions, approve final content	Accuracy, truth, final approval.
ChatGPT	Organize information, identify missing details, draft instructions	Do not assume unknown facts.
Claude	Generate and edit the website files, implement design and functionality	Do not add invented facts or destructive rewrites without checking.

TIP

A useful mental model

ChatGPT is the planner/editor. Claude is the builder. GitHub is the storage + publishing layer. You are the product owner.

This separation makes the workflow easier to debug. If the website looks wrong, ask Claude to fix the implementation. If the information is wrong, return to ChatGPT and your source documents.

4. What to Prepare Before You Start

Create one folder on your computer called something like **Portfolio Materials**. Put copies of your source files there.

Recommended materials

- Your latest CV in PDF format.
- Project reports, slide decks, notebooks or documentation you want represented.
- Certificates and credential links.
- Your GitHub profile URL.
- Your LinkedIn URL.
- A professional email address.
- A professional photograph only if you genuinely want one on the site.
- Any existing portfolio files if you are updating an old website rather than starting from zero.

For the GLEEBOI example, the portfolio work referenced a CV, Python certificates, a hospitality capstone slide deck and capstone documentation. The original prompt explicitly instructed Claude to analyze uploaded files rather than invent project details. ■filecite■turn1file2■

CHECK Privacy check

Remove passwords, private API keys, personal identification numbers, bank information and other secrets before uploading files to any AI tool.

5. Step 1: Give ChatGPT Your Information

Start with your CV because it is the most compact source of your professional identity.

In ChatGPT:

- Start a new conversation for the portfolio project.
- Upload your CV using the attachment button.
- Tell ChatGPT that the CV is the source of truth for your professional history.
- Ask it to extract your information into clear categories.

Copy-ready prompt

I am building a professional personal portfolio website.

I have uploaded my current CV. Treat it as a source of truth.

Extract and organize the information into:

1. Name and professional title
2. Professional summary
3. Education
4. Work experience
5. Internships
6. Technical skills
7. Programming languages
8. Tools and platforms
9. Projects
10. Certifications
11. Contact information
12. Portfolio-relevant achievements
13. Missing information that I should provide

Do not invent facts. If something is not in the CV, label it as "Not provided."

Keep the wording concise and suitable for a Data Scientist / Machine Learning Engineer portfolio.

GOOD Why this step matters

You are creating a clean information layer before asking Claude to design anything. This reduces contradictions and prevents the website prompt from becoming too vague.

6. Step 2: Ask ChatGPT to Find Missing Information

A portfolio needs more than a CV. Ask ChatGPT to identify the missing pieces before you build.

Using the CV information above, create a "Portfolio Information Checklist".

Separate the checklist into:

- A. Already known
- B. Missing but necessary
- C. Optional
- D. Information I should NOT invent

For every missing item, explain why it matters to a recruiter.

Pay special attention to:

- project links
- GitHub repositories
- certification verification links
- project outcomes
- tools actually used
- employment dates
- contact links
- CV download file
- professional title
- short hero tagline

Do not fill the missing fields with guesses.

Example of a good result

Field	Status	Action
GitHub	Known	Use the exact URL.
LinkedIn	Known	Use the exact URL.
Project result	Missing	Ask the user or inspect project documentation.
Certification date	Missing	Use credential evidence if available.
Years of experience	Unknown	Do not invent.

7. Step 3: Ask ChatGPT to Build Your Claude Prompt

Now ask ChatGPT to convert the organized information into a detailed build brief for Claude.

Create a master prompt for Claude to build my portfolio website.

The prompt must include:

- professional identity
- target roles
- visual direction
- technical constraints
- required sections
- exact verified contact links
- CV download requirements
- project presentation requirements
- certification requirements
- responsive/mobile requirements
- accessibility requirements
- performance requirements
- SEO requirements
- file/folder structure
- rules against invented information
- a final QA checklist

Write the prompt so Claude can execute it as a senior front-end developer, UI/UX designer and technical recruiter.

Do not invent any personal information.

For GLEEBOI, the source brief establishes the identity as **Data Scientist | Machine Learning Engineer**, the tagline **Building intelligent solutions through data, machine learning, and artificial intelligence.**, and the futuristic but restrained visual direction. ■filecite■turn1file0■

8. Step 4: Open Claude and Prepare the Workspace

Open Claude and create a conversation dedicated to the portfolio. The exact interface may change, but the important concept is that Claude needs access to the source files and a clear build instruction.

Before sending the master prompt:

- Upload the CV.
- Upload relevant project documentation.
- Upload certificates if you want Claude to inspect them.
- Upload existing website files if you are updating an existing site.
- Tell Claude what is authoritative and what is only inspiration.

CHECK Do not rush the prompt

If Claude does not have the files it needs, the model may produce a visually impressive site with incomplete or invented content. Give it the evidence first.

9. Step 5: Send the Master Website Prompt

The master prompt should tell Claude what to build, what not to change, what files to create, and how to verify the result.

A strong prompt has six layers

- **Identity:** who the website represents.
- **Design:** visual system, typography, spacing, motion and responsive behavior.
- **Content:** sections and exact information.
- **Engineering:** HTML/CSS/JavaScript structure, accessibility and performance.
- **Evidence:** CV, projects and credentials.
- **QA:** a final verification pass before declaring the work finished.

The GLEEBOI prompt specifically requests HTML5, CSS3 and vanilla JavaScript, with no Bootstrap, Tailwind or React, and a clean production-ready structure. ■filecite■turn1file0■

Important instruction to include

```
Before changing any existing file:
1. Inspect the current structure.
2. Preserve useful content.
3. Do not remove sections unless they are explicitly approved.
4. Do not invent facts.
5. Do not replace real links with placeholders.
6. After editing, check every internal and external link.
7. Return a concise change summary.
```

10. Step 6: Review the Website Claude Creates

Do not immediately publish the first version. First inspect it like a recruiter and then like a developer.

Recruiter review

- Can I understand the person's role within five seconds?
- Is the professional title clear?
- Is the strongest project visible without hunting?
- Can I find the CV quickly?
- Can I contact the person quickly?
- Does the site look intentional rather than like a template?

Technical review

- Do all navigation links work?
- Do project buttons go to the correct destinations?
- Does the CV open?
- Do images load?
- Does the site work on a phone?
- Are there console errors?
- Are files referenced with correct relative paths?

TIP

The five-second test

Open the homepage and look at it for only five seconds. Then close it. If you cannot explain who the person is, what they do and where to find their proof, the

11. Step 7: Ask Claude to Run a Recruiter + Technical QA

Use a separate QA instruction after the first build. This turns the model from creator into critic.

Perform a final QA review of this portfolio.

Act simultaneously as:

1. a technical recruiter
2. a senior machine learning engineer
3. a front-end engineer
4. a UX reviewer

Check:

- first impression
- professional branding
- clarity of target role
- project credibility
- technical terminology
- broken or placeholder links
- CV download
- certification verification
- mobile responsiveness
- accessibility
- SEO basics
- performance risks
- console errors
- missing alt text
- navigation
- spelling and grammar
- inconsistent dates
- invented or unsupported claims

Do not rewrite everything automatically.

First produce:

- A. Critical issues
- B. Important improvements
- C. Optional polish

Then fix only A and B unless I explicitly approve C.

The original GLEEBOI brief similarly asks for a final review from the perspective of a Google AI recruiter, senior ML engineer and technical hiring manager, including first impression, technical credibility, project quality, ATS keywords, missing sections, wording and design. ■filecite■turn1file2■

12. Step 8: Test Links, Files, Mobile and Content

Before GitHub, test the site locally or inside the preview environment available to you.

Test every clickable item

- Logo / home link
- Navigation links
- View Projects
- Download CV
- Email
- LinkedIn
- GitHub
- Project repository links
- Credential verification links

Test the CV path

```
assets/  
■■■ cv/  
    ■■■ Abdulazeem_Ayomide_Data_Scientist_CV.pdf
```

If the HTML contains:

```
href="assets/cv/Abdulazeem_Ayomide_Data_Scientist_CV.pdf"
```

then that exact folder and filename must exist relative to the HTML page. Capitalization and spelling matter on many hosting environments.

13. Step 9: Understand Your Website Files

You do not need to become a professional front-end developer to understand the basic structure.

```
portfolio/  
  index.html  
  css/  
    style.css  
    animations.css  
    responsive.css  
  js/  
    app.js  
    particles.js  
  assets/  
    images/  
    icons/  
    svg/  
    cv/  
    certifications/  
  README.md
```

File / folder	What it does
index.html	The main page structure and content.
style.css	Main visual styling.
animations.css	Motion and transition rules, if separated.
responsive.css	Phone/tablet layout rules, if separated.
app.js	Interactive behavior.
particles.js	Background particle/neural effect, if used.
assets/	Images, icons, CVs, certificates and other files.
README.md	Human-readable project documentation.

14. Step 10: Create the GitHub Repository

GitHub Pages can publish a repository as a website. For a personal user site, GitHub's quickstart uses the repository name **username.github.io**. ■cite■turn0search2■

Click-by-click

- Open GitHub in your browser and sign in.
- Click the + menu in the upper-right corner.
- Choose **New repository**.
- If you are creating a personal user site, enter your GitHub username followed by **.github.io**.
- Choose the appropriate visibility. For GitHub Free user sites, GitHub's documentation states that the repository must be public.
- Optionally add a README.
- Click **Create repository**.

The screenshot shows the GitHub 'Create a new repository' interface. At the top, there's a header with the GitHub logo and the title 'GitHub: Create a new repository'. Below this, the owner is set to 'your GitHub account'. The repository name field is highlighted with a blue border and contains the text 'Repository name: yourusername.github.io'. The description field contains 'Description: Professional portfolio website'. The visibility dropdown is also highlighted with a blue border and shows 'Visibility: Public, when required by your plan'. A blue tip box at the bottom contains the text: 'TIP Do not confuse the repository with the website The repository is where your files live. GitHub Pages is the publishing service that turns those files into the live website.'

Illustrative screenshot-style walkthrough

15. Step 11: Upload the Website to GitHub

Once the repository exists, upload the actual website files. The most important file is normally **index.html**. GitHub Pages looks for an entry file such as **index.html** at the top level of the publishing source. ■cite■turn0search3■

Recommended upload structure

```
yourusername.github.io/  
■■■ index.html  
■■■ css/  
■■■ js/  
■■■ assets/  
■■■ README.md
```

If you upload a folder containing another folder, check that you did not accidentally create this:

```
yourusername.github.io/  
■■■ portfolio/  
■■■ index.html
```

That can cause a deployment to publish the wrong location depending on the selected source.

16. Step 12: Turn On GitHub Pages

GitHub's current documentation describes the branch-based flow as: repository → Settings → Pages → Build and deployment → Source → Deploy from a branch → choose branch and folder → Save. ■cite■turn0search0■

Click-by-click

- Open your website repository.
- Click **Settings**.
- In the left sidebar, find the Pages area under the repository settings.
- Under **Build and deployment**, find **Source**.
- Select **Deploy from a branch**.
- Select the branch containing your website, commonly **main**.
- Select the publishing folder. For files stored at the repository root, select **/(root)**.
- Click **Save**.

17. Step 13: Open and Test the Live Website

After saving the Pages configuration, GitHub builds and deploys the site. GitHub notes that publishing can take a few minutes and that changes can take up to about ten minutes to appear. ■cite■turn0search4■

When the site is live:

- Open the published URL.
- Refresh the page.
- Open the site in an incognito/private window.
- Test on your phone.
- Test the CV download.
- Test LinkedIn and GitHub links.
- Click every navigation item.
- Look for broken images.
- Look for missing CSS.
- If something changed recently, allow a few minutes for deployment before assuming the deployment failed.

18. Step 14: Updating the Website Later

You do not need to rebuild the portfolio every time you earn a certificate or finish a project.

Use a small-change workflow

- Add the new source material.
- Ask ChatGPT to extract the new information and identify where it belongs.
- Ask Claude to modify only the relevant section.
- Tell Claude not to alter unrelated sections.
- Review the changed files.
- Test locally/preview.
- Commit the change to GitHub.
- Check the live site.

Only update the Certifications section.

Add this new certification using the information in the uploaded certificate.

Do not redesign the site.

Do not change the hero.

Do not change navigation.

Do not rewrite my existing experience.

Do not invent a date or credential number.

After editing, verify that:

1. the certification card is responsive
2. the credential link works
3. the existing design remains unchanged

19. Troubleshooting: Common Problems

Problem	Likely cause	First action
Site is blank	index.html missing, wrong source folder, or HTML error.	Confirm index.html is at the top of the publishing source.
CSS is not loading	Wrong relative path.	Check href paths and capitalization.
Images are broken	Wrong image path or filename.	Check exact asset path and filename.
CV does not open	Wrong path or file not uploaded.	Compare the href with the actual repository path.
Old version appears	Deployment still processing or browser cache.	Wait a few minutes, then hard refresh/private window.
Claude removed something	Prompt allowed broad rewriting.	Restore from the previous version and use a targeted change prompt.
Claude invented details	Source material was incomplete or prompt was vague.	Remove the claim and instruct Claude to use only evidence.
Mobile layout is broken	Responsive CSS is incomplete.	Ask Claude to audit at mobile widths and fix only responsive rules.

TIP

Debugging order

Check the repository structure first, then the publishing source, then file paths, then the code itself. Do not randomly change five things at once.

20. How to Ask Claude for Safe Changes

The quality of the result often depends on how narrowly you define the change.

Bad request

Make the website better.

Better request

Improve only the Projects section.

Goals:

- make project cards easier to scan
- keep the current color palette
- keep the current typography
- preserve all existing project information
- do not change the hero or navigation
- do not invent metrics
- keep all existing project links

Before editing, inspect the current HTML and CSS.

After editing, list exactly which files changed and what changed.

This is the difference between giving Claude a destination and giving it a runway.

GOOD **Version control habit**

Before a major change, keep a copy of the working version or use Git commits so you can return to a known-good state.

21. The GLEEBOI Worked Example

The following example shows how the guide translates into a real portfolio brief. Replace the personal information with your own when teaching someone else.

Identity

Field	Worked example
Brand	GLEEBOI
Professional title	Data Scientist Machine Learning Engineer
Hero tagline	Building intelligent solutions through data, machine learning, and artificial intelligence.
Location	Lagos, Nigeria
Education	B.Sc. Plant Science & Biotechnology
Languages	Python, SQL, R
Focus	Machine Learning, Data Analytics, Statistical Modeling, Artificial Intelligence

The original brief also specifies tools such as Pandas, NumPy, Scikit-learn, TensorFlow, PyTorch, Power BI, Git and Jupyter Notebook, plus interests in predictive analytics, AI applications, data-driven solutions and machine learning systems. [filecite turn1file0](#)

Contact example

Channel	Value
Email	ayomideabdulazeem@gmail.com
LinkedIn	linkedin.com/in/abdulazeem-ayomide-28a5b6375
GitHub	github.com/gleeboi

CHECK Evidence rule

The GLEEBOI brief explicitly says not to invent certification details, CV content, experience or project results. That rule should be copied into any portfolio w

22. Final Recruiter Checklist

Identity

- Professional title is immediately visible.
- Hero message explains the person's value.
- Name/brand is consistent everywhere.
- No exaggerated or unsupported claims.

Projects

- At least one strong project is easy to find.
- Each project explains the problem and approach.
- Technologies are accurate.
- Links work.
- Results are supported by source material.

Evidence

- CV download works.
- Certifications are verifiable.
- GitHub profile is correct.
- LinkedIn profile is correct.

Engineering

- No broken navigation.
- No broken images.
- No missing CSS.
- No obvious console errors.
- Mobile layout is usable.
- Accessibility basics are addressed.

Publishing

- index.html is in the correct publishing source.
- GitHub Pages source is configured correctly.
- The live URL opens.
- The latest changes are visible.

GOOD Final rule

Do not send the portfolio link to recruiters until you have tested it as if you were a recruiter who has never met you.

23. Screenshot Plan for the HTML Version

Because actual screenshots of a user's private Claude workspace or GitHub account cannot be reliably fabricated, this PDF uses clearly labeled screenshot-style walkthroughs. When converting the guide into HTML, replace each panel with a real screenshot if you have one.

Screenshot	Where to place it	What the image should show
01	Repository creation	GitHub + menu → New repository
02	Repository naming	Repository name field showing username.github.io
03	Repository files	index.html, css, js and assets visible
04	Settings	Repository Settings tab
05	Pages	Pages under repository settings
06	Source	Deploy from a branch + main + /(root)
07	Live site	Published website URL and homepage
08	Mobile test	Portfolio rendered on a phone-sized viewport
09	Claude workspace	Uploaded files and master prompt area
10	Claude output	Generated website/files or preview area

Screenshot annotation standard

- Use a numbered circle for each click.
- Use one highlight box around the exact control.
- Use a short caption underneath.
- Do not highlight five unrelated controls in one screenshot.
- Blur or crop personal information that does not need to be shown.
- For GitHub screenshots, make sure the username is intentionally shown only if you want it public.
- For Claude screenshots, remove private conversation content before sharing the guide.

24. Final Workflow: From CV to Live Portfolio

This is the entire process compressed into one repeatable sequence.

#	Stage	What happens
1	Collect	CV + projects + certificates + links
2	Extract	ChatGPT organizes the facts
3	Gap-check	ChatGPT identifies missing information
4	Brief	ChatGPT creates the Claude build prompt
5	Build	Claude creates/edits the website
6	Review	You inspect the first version
7	QA	Claude audits recruiter + technical quality
8	Test	You verify links, files and mobile
9	Publish	GitHub repository + GitHub Pages
10	Verify	Open the live site and test again
11	Maintain	Make small evidence-based updates

GOOD The simplest version

If the reader remembers only one thing: give ChatGPT the truth, give Claude the plan, give GitHub the files, and give yourself the final approval.
